

Engage powerful automation to help you successfully launch, manage, and monetize your connected device business.

Unlimit Control is a cloud-based platform that enables companies to launch, manage and monetize IoT/M2M services for connected devices across the world. More than four thousand companies across dozens of industries in more than 100 countries use Cisco Jasper Control Center to launch, manage and monetize their IoT/M2M deployments.

Deliver a high level of service reliability and ensure a superior customer experience.

Count on Unlimit Control to help you deliver the service your customers expect. Control Center provides real-time network connectivity feeds, service diagnostics, and extraordinary automation options to enable unparalleled visibility and control.

Use Control Center to quickly troubleshoot issues and monitor specific behavior. Increase service reliability and lower support costs by setting rules to immediately address undesirable behavior by proactively preventing issues.

Control Center enables you to:

- View deployed devices at-a-glance, with real-time network connectivity status.
- Quickly identify most common device issues with an automated diagnostics wizard —simple enough for non-technical users, with enough information to resolve most concerns.
- Give technical users instant access to historical data and deep network connectivity information to resolve complex issues.
- Monitor for unusual behavior and take immediate action. For example, instantly deactivate a device that is exceeding a standard number of sessions or expected data usage.

Lower operational costs with near zero-touch device lifecycle management.

Take advantage of Control Center's full range of automation options to drive efficiency and profitability. Start with automated provisioning, and then set controls to automatically manage device behavior in the field. You will eliminate manual interaction, which saves time and money, reduces errors, and enables you to scale faster.

Using Unlimit Control you can:

- Automate the provisioning of SIMs, based on your devices' unique lifecycle and specific business model. For example, you might include data for factory testing, but only shift the device to a billable state when the user first connects it.
- Select post-paid, pre-paid, pooled or individual rate plans. Set high or low usage that varies by geography or type of data traffic.
- Streamline workflows with automation. For example, you can automatically change SIM states, rate plans and network services, and send notifications based on lifecycle stage or data usage.

Build your business on a platform that will scale easily as you grow.

Whether you are starting small and building or already have millions of devices to connect, Unlimit Control is the smart way to manage your deployment. Delivered as a software-as-a-service solution, Unlimit Control is purpose built for IoT and designed for near-infinite scale. When you choose Unlimit Control you can:

- Add capacity as you grow, taking full advantage of all of Control Center's automation capabilities to truly optimize your business.
- Integrate easily with your front end systems using a robust library of standards-based APIs. Use rules-driven push APIs for more advanced automation and even deeper integration.
- Extend your business into new geographies by using the same platform to manage deployments around the globe.

Try out Unlimit Control today.

Get instant, hands-on experience with the power of Unlimit Control. Order an Unlimit IoT Starter Kit today. You will receive trial SIMs and full access to Unlimit Control so you can see for yourself why this is the world's leading IoT platform.
